

Launch Accounts Checklist

Third-party accounts and API keys needed before a real launch

This is the list of outside accounts the app needs before real users can book, pay, and get paid. Check each box as you set it up, then send the resulting keys back so they can be wired in — no code changes needed on your end.

Required — blocks a real launch

Set these up first. Stripe and the production database matter most — everything else can trail in after.

SERVICE	WHAT IT'S FOR	WHAT WE NEED FROM YOU
☐ Stripe Business account + Connect (Express) enabled	Charges customers and pays professionals out. Without it, no one can pay or get paid in-app.	Secret key + publishable key + Connect webhook secret
☐ Production database (Turso) A Turso account (SQLite-compatible, free tier works)	Where all real bookings, users, and messages live permanently. The app already speaks this database natively — no rebuild needed.	Database URL + auth token
☐ Domain name A registered domain (e.g. boujeebook.app)	The web address the live app and emails will use. Also needed to set up Stripe and app-store listings later.	Domain purchased through any registrar
☐ Transactional email (Resend) A Resend or Postmark account	Delivers password-reset links and account emails. Without it, reset links only appear in server logs.	API key
☐ Object storage (Cloudflare R2) An R2 or AWS S3 bucket	Stores professional license photos, ID photos, and portfolio images. No upload flow works without this.	Bucket name + access key + secret key
☐ ID verification (Persona) A Persona or Checkr account	Automates verifying a professional's license and background before they're marked "verified."	API key

Launch Accounts Checklist

Third-party accounts and API keys needed before a real launch

Optional — adds polish, not required to launch

The app works fully without these. Add them whenever it's convenient.

SERVICE	WHAT IT'S FOR	WHAT WE NEED FROM YOU
☐ Twilio SMS reminders	Sends text reminders in addition to in-app notifications. The app works fully without it.	API key + a phone number
☐ Sentry Error monitoring	Alerts the team automatically when something breaks in production, instead of finding out from a user.	Project DSN key
☐ Plausible or Google Analytics Traffic analytics	Basic visitor and usage numbers. Purely optional — the app has no tracking built in by default.	Site ID / tracking snippet

Already free — nothing to request: Google Fonts and the OpenStreetMap live-tracking map both run at zero cost with no key. Hosting and deployment are handled separately by the dev team.

Questions about any of these? Reply to whoever sent you this checklist.
